II. Read the following passage and circle the letter A, B, C, or D to indicate the correct answer to each of the questions.

The ability to conduct electricity is one of the key properties of a metal. Other solid material such as silicon can conduct electricity but only effectively at certain temperatures. Also, some substances such as salt (sodium chloride) can conduct when molten or when dissolved in water. The ability of metals to conduct electricity is due to how their atoms bond together. In order to bond together the metal atoms, lose at least one of their **outermost** electrons. This leaves the metal atoms with a positive charge and they are now strictly ions. The lost electrons are free to move in what are known as a sea of electrons. Since the electrons are negatively charged, they attract the ions and this is what keeps the structure together.

An electric current is a flow of charge and since the electrons in the sea of electrons are free to move they can be made to flow in one direction when a source of electrical energy such as a battery is connected to the metal. Hence we have an electric current flowing through the wire, and this is what makes metals such good conductors of electricity. The only other common solid conducting material that pencil users are likely to encounter is graphite (what the 'lead' of a pencil is made from). Graphite is a form of carbon and again the carbon atoms bond in such a way that there is a sea of electrons that can be made to flow as an electric current. Likewise, if we have an ionic substance like salt we can make the electrically charged ions flow to create a current but only when those ions are free to move, either when the substance is a liquid or dissolved in water. In its solid state an ionic substance like salt cannot conduct electricity as its charged ions cannot flow.

Electrical insulators are substances that cannot conduct electricity well either, because they contain no charged particles or any charged particles they might contain do not flow easily. Water itself is a poor conductor of electricity as it does not contain a significant amount of fully charged particles (the ends of a water molecule are partly charged but overall the molecule is neutral). However, most water we encounter does contain dissolved charged particles, so it will be more conductive than pure water. Many of the problems that occur when touching electrical devices with wet hands result from the ever-present salt that is left on our skin through perspiration and it dissolves in the water to make it more conductive.

Question 11: Electrical conductivity is _____.

- A. one of the most important properties of metals
- B. one of the key properties of most solid materials
- C. impossible for any substance when it is dissolved in water
- D. completely impossible for silicon

Question 12: According to the passage, a metal can conduct electricity due to _____.

- A. the absence of free electrons
- B. its atoms with a positive charge
- C. the way its atoms bond together
- D. the loss of one electron in the core of its atoms

Question 13: The word "**outermost**" in paragraph 1 mostly means _____.

- A. the lightest.
- B. nearest to the inside.
- C. furthest from the inside.
- D. the heaviest.

Question 14: The atoms of a metal can bond together because _____.

- A. the lost electrons cannot move freely in the sea of electrons
- B. electrons can flow in a single direction
- C. they lose all of electrons
- D. negatively charged electrons attract positive ions

Question 15: Salt in its solid state is not able to conduct electricity because _____.

- A. it has free electrons
- B. its charged ions can flow easily
- C. it cannot create any charge ions
- D. its charged ions are not free to move

Question 16: The word "**they**" in paragraph 3 refers to _____.

- A. charged ions

Question 17: Water is a poor conductor because it contains _____.

- A. no positive or negative electric charge
- B. only a small amount of fully charged particles
- C. only a positive electric charge
- D. only a negative electric charge

Question 18: We can have problems when touching electrical devices with wet hands because _____.

- A. the water itself is a good conductor of electricity
- B. the water dissolves the salt on our skin and becomes more conductive
- C. the water contains too many neutral molecules
- D. the water containing no charged particles makes it more conductive

Question 19: Which of the following is NOT true according to the passage?

- A. Pure water is much more conductive than most water we encounter every day.
- B. Graphite is a common solid substance that can conduct electricity.
- C. Salt can conduct electricity when it is molten or dissolved.
- D. Some materials are more conductive than others.

Question 20: Which of the following could best serve as the title of the passage?

A. Electrical Energy

B. Electrical Devices

C. Electrical Insulators

D. Electrical Conductivity

III. Read the passage and choose the correct heading for each paragraph from the list of headings below. There are MORE headings than needed. Write your answers in the spaces provided.

List of Headings

- i. First Contact
- ii. Coffee Varieties
- iii. Modern Coffee
- iv. The Spread of Coffee
- v. Consuming Coffee
- vi. The Coffee Plant

A

Coffee was first discovered in Eastern Africa in an area we know today as Ethiopia. A popular legend refers to a goat herder by the name of Kaldi, who observed his goats acting unusually friskily after eating berries from a bush. Curious about this phenomenon, Kaldi tried eating the berries himself. He found that these berries gave him renewed energy.

B

The news of this energy laden fruit quickly moved throughout the region. Coffee berries were transported from Ethiopia to the Arabian Peninsula, and were first cultivated in what today is the country of Yemen. Coffee remained a secret in Arabia before spreading to Turkey and then to the European continent by means of Venetian trade merchants.

C

Coffee was first eaten as a food though later people in Arabia would make a drink out of boiling the beans for its narcotic effects and medicinal value. Coffee for a time was known as Arabian wine to Muslims who were banned from alcohol by Islam. It was not until after coffee had been eaten as a food product, a wine and a medicine that it was discovered, probably by complete accident in Turkey, that by roasting the beans a delicious drink could be made. The roasted beans were first crushed and then boiled in water, creating a crude version of the beverage we enjoy today. The first coffee houses were opened in Europe in the 17th Century and in 1675, the Viennese established the habit of refining the brew by filtering out the grounds, sweetening it, and adding a dash of milk.

D

If you were to explore the planet for coffee, you would find about 60 species of coffee plants growing wild in Africa, Malaysia, and other regions. But only about ten of them are actually cultivated. Of these ten, two species are responsible for almost all the coffee produced in the world: *Coffea Arabica* and *Coffea Canephora* (usually known as Robusta). Because of ecological differences existing among the various coffee producing countries, both types have undergone many mutations and now exist in many sub-species.

E

Although wild plants can reach 10 - 12 metres in height, the plantation one reaches a height of around four metres. This makes the harvest and flowering easier, and cultivation more economical. The flowers are white and sweet-scented like the Spanish jasmine. Flowers give way to a red, darkish berry. At first sight, the fruit is like a big cherry both in size and in colour. The berry is coated with a thin, red film (epicarp) containing a white, sugary mucilaginous flesh (mesocarp). Inside the pulp there are the seeds in the form of two beans coupled at their flat surface. Beans are in turn coated with a kind of resistant, golden yellow parchment, (called endocarp). When peeled, the real bean appears with another very thin silvery film. The bean is bluish green verging on bronze, and is at the most 11 millimetres long and 8 millimetres wide.
